Rabbit Spay

What is a Spay (Ovariohysterectomy)?

A spay involves removal of the uterus and ovaries. This is done by entering the abdomen through a small incision near the belly button. All rabbits are sent home with pain control medication. Most animals tolerate this procedure well and return to their normal activity within 3-4 days. We consider the spay incision to be healed 2 weeks after surgery and recommend keeping a onesie on during this time.

Why is it important to get my rabbit Spayed?

Benefits of a spay include:

- Decrease unwanted pregnancies and surplus animal population
- Prevent uterine infections that can be fatal
- Prevent uterine and ovarian cancer (very common in rabbits)
- Decrease marking and territorial behaviors
- Decrease inter-rabbit aggression

We recommend
spaying ALL
rabbits by
6 months of age.

What is the cost of a Rabbit Spay?

Pre-Surgery Package		Surgery Package	
Pre-Operative wellness exam	\$120	Spay surgery bundle	\$327
• Check for conditions that cause increased anesthetic risk (ie – heart murmurs)		• IV fluids
